Profile

Driven Cybersecurity Professional, Ethical Hacker & Python Full Stack Developer combining dual expertise in secure software engineering and proactive threat assessment. Experienced in building end-to-end applications with Python, Django, and Flask and Fast API, alongside executing rigorous Vulnerability Assessment & Penetration Testing methodologies to harden enterprise systems. Strong history of uncovering critical vulnerabilities, streamlining system performance and delivering high performing, secure technical solutions aligned with business goals.

Education

Parul Institute Of Engineering & Technology

Bachelor Of Engineering In Computer Science & Engineering

July 2023 – June 2027

Gujarat, Vadodara

Experience

Parul Institute Of Engineering & Technology

Ethical Hacking & Penetration Testing Intern

Aug 2026 – Dec 2026

Gujarat, Vadodara

- **Offensive Security & End-to-End VAPT** Conducted comprehensive Vulnerability Assessment and Penetration Testing (VAPT) across simulated enterprise networks, Web APIs, and hybrid Linux/Windows environments identifying critical security risks and OWASP Top 10 vulnerabilities.
- **Security Automation & Tooling** Leveraged industry-standard security tools including Burp Suite, Nmap, Metasploit, and Wireshark alongside custom Python automation scripts to streamline network reconnaissance, execute controlled exploitation, and accelerate vulnerability triage.
- **Risk Reporting & Remediation** Authored formal VAPT executive reports mapping findings to CVSS severity framework, delivering root cause analysis and actionable, step-by-step remediation strategies to harden application architecture and infrastructure.

Projects

Email Security Gateway With Threat Intelligence & Digital Forensics

- **Enterprise Threat Mitigation Engine** Engineered a high-throughput Python/Flask Email Security Gateway and browser telemetry extension to detect and block zero-day phishing, credential harvesting, and Business Email Compromise (BEC) attacks bypassing legacy filters.
- **Automated Protocol Validation & IoC Enrichment** Programmed automated email header analysis pipelines to enforce SPF, DKIM, and DMARC authentication while integrating Virus Total V3 APIs to cross-reference extracted domains, URLs, and attachment hashes against real-time global threat feeds.
- **Risk Scoring & Immutable Forensic Logging** Built a modular multi-factor risk-scoring algorithm for automated threat classification (*Safe / Suspicious / Malicious*), backed by an asynchronous SQLite logging architecture ensuring immutable audit trails and Chain of Custody for SOC incident response.

Technical Skills

Languages : Python, C, HTML/CSS, JavaScript, Bootstrap, Oracle (SQL)

Developer Tools : Vs Code, PyCharm, Git, GitHub

Technologies/Frameworks : Kali Linux, Django, Flask, Fast API
